On Becoming Human

An Introduction

*Becoming Human: Matter and Meaning in an Antiblack World* argues that key texts of twentieth-century African diasporic literature and visual culture generate unruly conceptions of being and materiality that creatively disrupt the human–animal distinction and its persistent raciality. There has historically been a persistent question regarding the quality of black(ened) people’s humanity. African diasporic literature and cultural production have often been interpreted as a reaction to this racialization—a plea for human recognition. *Becoming Human* takes a different approach, investigating key African American, African, and Caribbean literary and visual texts that critique and depose prevailing conceptions of “the human” found in Western science and philosophy. These texts move beyond a critique of bestialization to generate new possibilities for rethinking ontology: our being, fleshy materiality, and the nature of what exists and what we can claim to know about existence. The literary and visual culture studied in *Becoming Human* neither rely on animal abjection to define being (human) nor reestablish “human recognition” within liberal humanism as an antidote to racialization. Consequently, they displace the very terms of black(ened) animality as abjection.

*Becoming Human* argues that African diasporic cultural production does not coalesce into a unified tradition that merely seeks inclusion into liberal humanist conceptions of “the human” but, rather, frequently alters the meaning and significance of being (human) and engages in imaginative practices of worlding from the perspective of a history of blackness’s bestialization and thingification: the process of imagining black people as an empty vessel, a nonbeing, a nothing, an ontological zero, coupled with the violent imposition of colonial myths and racial hierarchy.¹ Toni Morrison’s *Beloved*, Nalo Hopkinson’s *Brown Girl in the Ring*, Audre Lorde’s *The Cancer Journals*, Wangechi Mutu’s *Histology of
the Different Classes of Uterine Tumors, Octavia Butler’s “Bloodchild,” Ezrom Legae’s Chicken Series, and key speeches of Frederick Douglass both critique and displace the racializing assumptive logic that has grounded Western science’s and philosophy’s debates on how to distinguish human identity from that of the animal, the object, and the nonhuman more generally. In complementary but highly distinct ways, these literary and visual texts articulate being (human) in a manner that neither relies on animal abjection nor reestablishes liberal humanism as the authority on being (human). Instead, they creatively respond to the animalization of black(ened) being by generating a critical praxis of being, paradigms of relationality, and epistemologies that alternately expose, alter, or reject not only the racialization of the human–animal distinction found in Western science and philosophy but also challenge the epistemic and material terms under which the specter of animal life acquires its authority. What emerges from this questioning is an unruly sense of being/knowing/feeling existence, one that necessarily disrupts the foundations of the current hegemonic mode of “the human.”

While we often isolate African diasporic literary studies from the fields of science and philosophy, I contend that African diasporic literature and visual culture introduce dissidence into philosophical and scientific frameworks that dominate definitions of the human: evolution, rights, property, and legal personhood. By reading Western philosophy and science through the lens of African diasporic literature and visual culture, we can situate and often problematize authoritative (even if troubling) conceptualizations of being and material existence, demonstrating that literary and visual cultural studies have an important role to play in the histories of science and philosophy. Using literature and visual art, my study identifies conceptions of being that do not rely on the animal’s negation, as repudiation of “the animal” has historically been essential to producing classes of abject humans. Becoming Human reveals that science and philosophy share many characteristics with literature and visual art despite the espoused objectivity and procedural integrity of scientific and philosophical discourses. In debates concerning the specificity of human identity with respect to “the animal,” science and philosophy both possess foundational and recursive investments in figurative, and arguably literary, narratives that conceptualize blackness as trope, metaphor, symbol, and a kind of fiction. Instead of thinking
of philosophy and science as separate and unrelated sites of knowledge production, my study reveals their historical entanglement and shared assumptive logic with regard to blackness. As conceived by evolutionary theory and Western Enlightenment philosophy, extending into legalistic conceptions of personhood, property, and rights, antiblackness has sought to justify its defacing logics and arithmetic by suggesting that black people are most representative of the abject animalistic dimensions of humanity, or the beast.

While many scholars have critiqued the conflation of black humans with animals found in Enlightenment discourses, I argue that prior scholarship has fundamentally misrecognized the logic behind the confluence of animality and racialization. I reinterpret Enlightenment thought not as black “exclusion” or “denied humanity” but rather as the violent imposition and appropriation—inclusion and recognition—of black(ened) humanity in the interest of plasticizing that very humanity, whereby “the animal” is one but not the only form blackness is thought to encompass. Plasticity is a mode of transmogrification whereby the fleshy being of blackness is experimented with as if it were infinitely malleable lexical and biological matter, such that blackness is produced as sub/super/human at once, a form where form shall not hold: potentially “everything and nothing” at the register of ontology. It is perhaps prior scholarship’s interpretation of this tradition as “denied humanity” that has facilitated a call for greater inclusion, as a corrective to what it deems is a historical exclusion of blackness. One consequence of this orientation is that many scholars have essentially ignored alternative conceptions of being and the nonhuman that have been produced by blackened people.

This project examines how African diasporic literary and visual texts generate conceptions of being that defy the disparagement of the nonhuman and “the animal.” The terms of African diasporic art and literature’s canonization have suggested that African diasporic cultural production does little more than refute racism and petition for assimilation into the very definition of humanity that produces racial hierarchy or, as Henry Louis Gates Jr. would put it in *The Signifying Monkey: A Theory of African-American Literary Criticism*: “[T]he texts of the slave could only be read as testimony of defilement: the slave’s representation and reversal of the master’s attempt to transform a human being into a commodity, and the slave’s simultaneous verbal witness
of the possession of a humanity shared in common with Europeans” (Gates 140). Rather than seek an assimilationist transubstantiation via the “Talking Book,” the texts in my study are better understood as providing unruly yet generative conceptions of being—generative because they are unruly. Yet, they are not always framed as an explicit critique of the dominant—thereby refusing the terms of liberal multicultural recognition, which require either the evocation of animalized depictions of blackness in order to point out the suffering these images cause or the reversal of stereotype in a bid for “inclusion.” Instead, they often just get on with upending and inventing at the edge of legibility. The chapters in this book explore the critique and innovative thought that emerge from within the contradictions of competing conceptions of modernity’s crucible—the human. I argue that the cultural production examined in the following pages reveals a contrapuntal potential in black thought and expressive cultures with regard to the human–animal distinction.

In order to facilitate a fuller appreciation of the conceptions of ontology identified in Becoming Human, I pose three arguments that fundamentally reframe the animalization of blackness. First, I argue that philosophers’ and historians’ emphasis on antiblack formulations of African reason and history have overlooked the centrality of gender, sexuality, and maternity in the animalization of blackness. Namely, I argue that black female flesh persistently functions as the limit case of “the human” and is its matrix-figure. This is largely explained by the fact that, historically, the delineation between species has fundamentally hinged on the question of reproduction; in other words, the limit of the human has been determined by how the means and scene of birth are interpreted. Second, I demonstrate that Eurocentric humanism needs blackness as a prop in order to erect whiteness: to define its own limits and to designate humanity as an achievement as well as to give form to the category of “the animal.” Third, I look beyond recognition as human as the solution to the bestialization of blackness, by drawing out the dissident ontological and materialist thinking in black expressive culture, lingering on modes of being/knowing/feeling that gesture toward the overturning of Man.

In debates concerning the specificity of human identity with respect to “the animal,” science and philosophy foundationally and recursively construct black femaleness, maternity, and sexuality as an essential index of abject human animality. Furthermore, gender, maternity, and
sexuality are central to the autopoesis of racialized animalization that philosophers, theoreticians, and historians of race hope to displace. While black feminist and queer theories of race have underlined the intersectional nature of gender, race, and sexuality, few studies have ventured to identify the autopoetic operations of these very intersections (Maturana and Varela 78). Therefore, any study that attempts to provide an account of how racialization operates must offer an explanation of the intransigent, recursive, self-referential, and (re)animating power of abject constructs of black gender and sexuality. Contributing to studies of the longue durée of antiblackness and “afterlife of slavery,” I offer a materialist theory of both blackness’s ontologized plasticization and the temporality of antiblackness whereby I extend and revise Sylvia Wynter’s theories of sociogeny and the autopoesis of racialization, in other words, antiblackness’s auto-institution and stable replication as a system and its consequences for our being both bios and mythos.⁵

Much has been written about the roles of Reason and History in the production of “dehumanization.” This discourse is most commonly represented by Georg Wilhelm Friedrich Hegel’s claim that “the African,” never attaining immanent differentiation or the clarity of self-knowledge, is imprisoned by immediacy and is, in other words, ahistorical. However, in the chapters that follow, I am most interested in the roles of gender and sexuality in the production of blackness as “animal man.” Negating discourses on African “history” and “reason” are not the only—and perhaps not even the most frequently deployed—concepts through which “the African” is posited as animal. Gender and sexuality feature prominently in animalizing discourse, as a measure of both the quality of the mind and an index of spirit.

Gendered and sexual discourses on “the African” are inextricable from those pertaining to reason, historicity, and civilization, as purported observations of gender and sexuality were frequently used to provide “evidence” of the inherent abject quality of black people’s human animality from the earliest days of the invention of “the human.” Christian Europe had already privileged gender and sexuality as indicators of “civilization,” and visual observation, namely culturally situated perspective, had not emerged as an epistemological problem for thought (Haraway, “Situated Knowledges”). During the so-called “Age of Discovery,” observation and the visual, imagined as transparent and in opposition to the opaque,
could overcome the practical problem of differences in worldings. Thus, observation of gender and sex was deployed in the interest of producing race as a visualizable fact. The body was believed to provide presence—a supplement to the immateriality of reason and historicity.

The black body’s fleshiness was aligned with that of animals and set in opposition to European spirit and mind. As Winthrop Jordan documents in *White over Black: American Attitudes toward the Negro, 1550–1812*, Africans and apes were linked through physiognomic comparison and sexuality. Englishmen had only encountered nonhuman primates vicariously through travel writing and gossip. They were unfamiliar with anthropoid primates, such as gorillas, chimpanzees, and orangutans. Encounters with sub-Saharan Africans occurred adjacent to these encounters, leading to unbridled speculations linking primates and Africans (Jordan 29, 229). These speculations were an outgrowth of an epistemological foundation that had already been circulating tales of mythical human-animal hybrids and humanoid animals based on ancient reports and medieval morality (Jordan 29). Africa was seen as a land of new monsters. Though Africans were rarely perceived as a kind of ape, it was more commonly suggested that Africans and apes shared libidinous sexual characteristics or were sexually linked (Jordan 32, 227, 230–32, 237). For the English, sex was barbaric, as the body was host to sin; and when they did not perceive Africans as observing the same Christian worldview, they evaluated them negatively. According to Jordan, Africans were linked with sins of the body, and their blackness was believed to testify to their unlawful and ungodly nature (Jordan 17–20, 36, 41). The purported carnality of the African female was thought to be exemplary of African sexuality more generally, as the female sex was the measure of a race’s civility (Jordan 35).

While the discussion here notes Jordan’s comments on the role of sexuality in the antiblack production of the discourse of African animality, one could reasonably suggest that at times this now-classic text naturalizes racial difference as a visualizable fact of the body with immediate, unitary aesthetic effects for Europeans. In Kathleen Brown’s reinterpretation of Jordan’s early modern sources, she notes that divisions of household labor between the sexes, manners and customs, and mores were as, if not more, central to West Africans’ function as foils to the emergent concept of Europeanness as skin color and hair texture (Brown, “Native Americans” 82). Despite what one might expect from
reading Jordan’s conclusions, skin color was not the essence of racial
difference in the pre-1650 sources: writers of the period devoted con-
siderable space to descriptions of indigenous peoples’ adornments of their
bodies, “the consequences of which were no less startling to English ob-
servers than differences which allegedly originated in nature” (K. Brown
90). The common criteria for bestial otherness were measures of degrees
of civility in Iberian and English sources rather than complexion. One
of the most common refrains in early European accounts of people liv-
ing near the so-called torrid zones was “the people goeth all naked” (K.
Brown 88). The appearance of allegedly naked bodies had contradictory
evocations: on the one hand, nakedness conjured images of the garden
of Eden and a prelapsarian state of mind, arrested development, and
innocence; on the other hand, “Nudity also communicated sexual pro-
miscuity and the absence of civility to Europeans, which they sometimes
described as ‘beastly’ living” (K. Brown 88). Rather than simply, or deci-
sively, a matter of color, projected sexual mores and virility were crucial
determinants for measuring the being of Africans.

As Jennifer Morgan has shown, the imagined proof of the enslaved’s
incivility and degraded humanity was frequently located in African
females’ purported childbearing and child-rearing practices, whereby
the breast of the enslaved took on mythic proportions. In this context,
the breast took on an emblematic status: “European writers turned to
black women as evidence of a cultural inferiority that ultimately be-
came encoded as racial difference. Monstrous bodies became enmeshed
with savage behavior as the icon of women’s breasts became evidence of
tangible barbarism” (191). African female breasts were depicted as ex-
aggeratedly long, even as bestial additional limbs. As Morgan asserts,
what this history demonstrates is not that “gender operated as a more
profound category of difference than race,” but rather that “racialist dis-
course was deeply imbued with ideas about gender and sexual di-
ference that, indeed, became manifest only in contact with each other” (169).
What observers and commentators did not question was their own uni-
versality, their grid of intelligibility, and how it conditioned not just what
they saw, or even how they observed, but how they knew what they saw.
This is an issue of perception that exceeds the question of what was actu-
ally observed and what was “made up” or “imagined”; instead of debat-
ing the facticity of a story, it is imperative to interrogate how we would
go about evaluating any empirical truth claim. This calls into question how we “know what we know,” not only about a world “out there” but also how we “know ourselves.” Epistemology is a problem not of the past but one that is constituent with our being.

By the nineteenth century, the Chain of Being’s physical anthropology, using human and animal physical measurements, sealed the connection between Africans and apes as scientific fact. One must only recall the manner in which Sara Baartman, the so-called Hottentot Venus, was displayed for the British and French public as both pornographic spectacle and scientific specimen (Gilman 88). Her physiognomic characteristics—posterior and genitals—were presumed to signal a difference in sexuality that was pronounced enough to further divide the categories of “female” and “woman”: an idealized white femininity became paradigmatic of “woman” through the abjection of the perceived African “female” (Gilman 83–85). Female, rather than woman, African femaleness is paradoxically placed under the sign of absence, lack, and pathology in order to present an idealized western European bourgeois femininity as the normative embodiment of womanhood (Gilman 85–108).

In this context, the potential recognition of womanhood in blackness, and especially black femininity, is placed in tension with the discourses on black female sexuality. Hortense Spillers put it this way: “In the universe of unreality and exaggeration, the black female is, if anything, a creature of sex, but sexuality touches her nowhere . . . the female has so much sexual potential that she has none at all that anybody is ready to recognize at the level of culture” (Black, White, and in Color 155, emphasis in original). The perpetual specter of black female lack in the realm of culturally and historically produced femininity, at the register of both performativity and morphology, produces “the African female” as paradigmatically indeterminate in terms of gender and paradigmatically the human’s limit case.

The spectacularization of the posterior has perhaps blinded our critical attention to the manner with which ontologizing racial characterization not only divides and stratifies gender but also calls into question the very meaning of sexual difference. Shifting critical attention from the posterior to the breast, I demonstrate that racism not only posits cleavages in womanhood such that black womanhood is imagined to be a gender apart (an “other” gender) but also an “other” sex. Additionally, antiblackness itself
is sexuating, whereby so-called biological sex is modulated by “culture.” In other words, at the registers of both sign and matter, antiblackness produces differential biocultural effects of both gender and sex. Such a frame raises the stakes of recent feminist materialism’s inquiry into both the inter(intra)actional relations of discursivity and materiality as well as the gendered politics of hylomorphism, or the form–matter distinction. Thus, antiblack formulations of gender and sexuality are actually essential rather than subsidiary to the metaphysical figuration of matter, objects, and animals that recent critical theory hopes to dislodge. I argue the plasticization of black(ened) people at the register of sign and materiality is central to the prevailing logics and praxis of the human and sex/gender.

Recent scholarship in black queer theory suggests we can no longer presume that gender is a metonym for “woman” and sexuality a metonym for “queer.” The wanton manipulation of gendered and sexual codes is essential to the production of antiblackness generally, irrespective of self-identification.⁶ Queer theory scholars have argued that the masculine–feminine dynamic is on the register of the symbolic, rather than the biological, even though it masquerades as if the borders dividing masculine from feminine map neatly onto the “natural” polarity of sex.⁷ What feminism has not sufficiently interrogated is the manner in which the masculine–feminine dichotomy is racialized. We have neither adequately identified that racialization is intrinsic to the legibility of its codes and grammar, namely that antiblackness constitutes and disrupts sex/gender constructs, nor determined the consequence this has for the matter of the sexed body.

Such a predicament creates conditions of gendered and sexual anxiety and instability. As Spillers states, “[I]n the historic outline of dominance, the respective subject-positions of ‘female’ and ‘male’ adhere to no symbolic integrity,” as their meaning can be stripped or appropriated arbitrarily by power, as black females’ claim to “womanhood and femininity still tends to rest too solidly on the subtle and shifting calibrations of a liberal ideology” (“Mama’s” 204, 223). Thus, while codes of gender are cultural rather than prediscursive, one must also attend to the matter of the body, as the body’s materiality is thought to provide the observable “fact” of animality.

The African’s “failure” to achieve humanity has historically been thought to be rooted in “the body,” in an insatiable appetite that made it impossible for the African to rise above “the body,” “the organ,” in order
to come back to itself in self-reflection, never achieving the distance required in order to contemplate the self (Mbembe 190). Gender, and especially sexuality, was leveraged against counterclaims acknowledging black reason and civility. For thinkers such as Thomas Jefferson, black gender and black kinship stood as an impediment to black progress. So, while it seems that the human must be reconsidered, a critical engagement with the discourses of gender and sexuality must be coincident to our interrogation of both dominant and emergent praxes of being.

At this time, most feminist scholars can agree that an “intersectional” approach to the question of subjectivity is required, but scholars have not clarified how the different elements of subjectivity braid together historically and culturally. In the chapters that follow, I hope to provide more precise thinking in this area. Our task would be to take seriously the particularization of gender and sexuality in black(ened) people in the context of a humanism that in its desire to universalize, ritualistically posits black(female)ness as opacity, inversion, and limit. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbinaristically, with fleeting adherence to normativized heteropatriarchal codes. In such a context, the black body is characterized by a plasticity, whereby raciality arbitrarily remaps black(ened) gender and sexuality, nonteleologically and nonbina
inheritance rather than determinism, and that somatic potential was qualified by purported degrees of binary sex differentiation, cast as the crowning achievement of the “civilized.” By comparison, black(ened) people appeared to be inert and undifferentiated—in other words, excessive to the domain of sexual difference.⁸

In contrast, the concept of plasticity in Becoming Human indexes a mode of domination that conditions the discourse and practices of optimization at the center of nineteenth-century sentimentality and accompanying theories of evolution, by suggesting that racial slavery fleshed out its imagination and provided the experimental means for exploring the possibilities and boundaries of the kind of optimization Schuller elucidates.⁹ Plasticity’s telos, I argue, is not the optimization of life per se but the fluidification of “life” and fleshly existence. Plasticity is certainly an antiblack mode of the human concerned with apportioning vitality and pathologization, but it is more than that. Plasticity is a praxis that seeks to define the essence of a black(ened) thing as infinitely mutable, in antiblack, often paradoxical, sexuating terms as a means of hierarchically delineating sex/gender, reproduction, and states of being more generally.

My suggestion is that slavery, as an experimental mode, sought to define and explore the possibilities and limits of sex, gender, and reproduction on the plantation and beyond in a manner distinct from but relational to the assumed proper subject of “civilization,” and, in fact, enabled hegemonic notions of sex/gender and reproduction such as “woman,” “mother,” and “female body.”¹⁰ I demonstrate that racial slavery as well as early modern proto-racializing conceptions of “monstrous” races and births are integral to ideas of sex/gender and reproduction, and indeed what it means to possess a body such that receding and emergent idea(l)s of mutability and optimization provide cover for historical and ongoing discursive-material modes of domination that precede and surround its idealized and retroactively constructed white(ened) subject and from which historical and current biomedical and philosophical discourses of plasticity seek to distance and obscure. Because antiblack modes of sex/gender and reproduction are generated by means and in terms different from the dominant, it is commonly assumed that such “excess” lay beyond the boundaries of the productions of sex/gender; Becoming Human suggests, instead, that the long arc of
modern raciosity reveals that the production of the “civilized” subject of sex/gender and reproduction is a retroactive construction and dependent on modes of generating sex/gender and reproduction imagined as excessive to its proper domain or otherwise invisibilized.

Liberal humanism’s basic unit of analysis, “Man,” produces an untenable dichotomy—“the human” versus “the animal,” whereby the black(ened) female is posited as the abyss dividing organic life into “human” or “animal” based on wholly unsound metaphysical premises. Thus, as a result of being abjectly animalized, those marginalized have had to bear the burden of a failed metaphysics. *Becoming Human* furthers black studies’ interrogation of humanism by identifying our shared being with the nonhuman without suggesting that some members of humanity bear the burden of “the animal.”

My second intervention is to demonstrate that exigencies of racialization, have, commonly, prefigured discourses on animals and the nonhuman, more generally and that the categories of “race” and “species” have coevolved and are actually mutually reinforcing terms. Current scholarship in posthumanism, animal studies, new materialism, and theories of biopolitics has begun a broad inquiry into the repercussions of defining “the human” in opposition to “the animal.” Much of the recent scholarship suggests that race is a by-product of prior negation of nonhuman animals. These fields, particularly animal studies, are slowly advancing the thesis that human–animal binarism is the original and foundational paradigm upon which discourses of human difference, including, or even especially, racialization was erected. The chapters that follow will take an alternative approach.

Far from being an inevitable feature of our thought, this dualism has been traced to none other than René Descartes. In “The Eight Animals in Shakespeare; or, Before the Human,” Laurie Shannon argues that historical attention to lexicons reveals that the “human–animal divide” descends from “Enlightenment modes of science and philosophy that have been largely qualified in contexts like subjectivity, rationality, and liberalism . . . To put it in the broadest terms: before the cogito, there was no such thing as ‘the animal’” (474). To illustrate the recentness of “the animal” as an impounding preoccupation, Shannon makes a striking observation: “While references to the creatures now gathered as animals defy inventory, the collective English word *animal* appears a mere eight times across
the entire verbal expanse of Shakespeare's work. His practice on this point of nomenclature tilts overwhelmingly against the word” (Shannon 474). Two of the eight uses of the word, Shannon notes, “involve persons failing a (gender- vexed and class-inflected) human standard”: “lack of self-government,” “unchastity,” quoting Much Ado “savage sensuality,” and in Love’s Labor’s Lost animality is evoked as intellectual inferiority.

Philosophers of race and Caribbeanist literary scholars have also detected the incipience of modern racialization in the work of Shakespeare. This scholarship notes that in The Tempest, Caliban, too, is placed under the sign of “the animal,” namely irrational and sexual intemperance. My argument is not simply that Caliban is animalized but rather that figures like Caliban are constitutive to “the animal” as a general term. Arguably more a personified idea than a traditional character, Caliban emerged in the context of publicity surrounding European voyages to the coast of Africa and the Caribbean. The black body, held captive as a “resource for metaphor,” has been discussed in the work of Frantz Fanon, in which he contends that black men’s bodies, like Caliban, are projection screens for white anxiety about sexuality (Spillers, “Mama’s” 205). But, instead of recognizing their projections as just that, projection, white anxiety imposes an image of black(ened) men as a bestial sexual threat: a powerful sexual menace, initiator of sexual activity unrestricted by morality or prohibition, or one who monopolizes gendered sexual pleasure. The result is envy, punishment, or masochistic pleasure; for the black is not the symbol of sexual threat but is sexual threat—the penis becomes the synecdoche of black manhood (Fanon 170, 177). My suggestion is that these subjects—“animal” as a generic term and the racialized masculine figure of Caliban—are intertwined and that their interrelation is ordered in relation to the absent presence of the material metaphor of the black female as matrix-figure. By uncovering the centrality of racialized gender and sexuality in the very human–animal binarism that scholars are looking to problematize or displace, I demonstrate the necessity of the abjection and bestialization of black gender and sexuality for both the normative construction of “the human” as rational, self-directed, and autonomous and as the reproduction of the scientific matrix of classification.

In addition to providing a crucial reexamination of African diasporic literature and visual culture’s philosophical defiance of Western scientific
and philosophic definitions of “the human,” *Becoming Human* clarifies the terms of the relationship between what Cary Wolfe calls the “discourse of species” and racial discourse by demonstrating that racialized gender and sexuality serve as an essential horizon of possibility for the production of “the animal” as a preoccupation of Modern discourse (*Animal Rites* 2). Reading the existential predicament of modern racial blackness through and against the human–animal distinction in Western philosophy and science not only reveals the mutual imbrication of “race” and “species” in Western thought but also invites a reconsideration of the extent to which exigencies of racialization have preconditioned and prefigured modern discourses governing the nonhuman. As I demonstrate, at times antiblackness preforges and colors nonhuman animal abjection. I argue that anxieties about conquest, slavery, and colonial expansionism provided the historical context for both the emergence of a developmental model of “universal humanity” and a newly consolidated generic “animal” that would be defined in nonhuman and human terms. In this context, discourses on “the animal” and “the black” were conjoined and are now mutually reinforcing narratives in the traveling racializations of the globalizing West. I demonstrate that both science’s and philosophy’s foundational authority articulate black female abjection as a prerequisite of “the human,” and this abjection helps give credence to the linear taxonomical (ontological) thinking present scholarship is trying to displace. Thus, racialized formations of gender and sexuality are actually central rather than subsidiary to the very human–animal binarism recent scholarship hopes to dislodge. *Becoming Human* emphasizes cultural production that philosophically challenges the abjection of animality and highlights alternative modes of being. The cultural production examined here does not figure the challenge of transforming ways of relating to animality as separate from the urgent need to reimagine (human)being because the semio-material burden of living as black virtually forecloses the “on behalf of” structure that characterizes so much of animal studies and, especially, its antecedents—animal ethics and animal rights philosophy. As I have established thus far, Western humanism has not produced African diasporic subjectivity in a manner that would permit black people to decisively remove themselves from being subjected to violence against “the animal.” For the Enlightenment humanists mentioned above, “the African” does not symbolize “the animal”; “the African” is “the animal.” The
black philosophical dissidence highlighted in this book speaks to the biopolitical entanglement of discourses on animals, environment, and African diasporic peoples. Thus, critical black studies must challenge animalization on at least two fronts: animalizing discourse that is directed primarily at people of African descent, and animalizing discourse that reproduces the abject abstraction of “the animal” more generally because such an abstraction is not an empirical reality but a metaphysically technology of bio/necropolitics applied to life arbitrarily.

Additionally, this project is not limited to a critique of anthropocentrism. As I have suggested here and will elaborate in the pages that follow, antiblackness’s arbitrary uses of power do not comply with the hierarchies presumed by critics of anthropocentrism. Furthermore, viruses, bacteria, parasites, and insects all commonly exercise dominance over human populations. Thus, critics such as Jacques Derrida and Cary Wolfe have foregrounded a need for a critical and accountable humanism rather than seeking ever-vigilant forms of anti-anthropocentrism. However, it is crucial to critically engage with what it means to be in a biopolitical context that is characterized by entanglements of humans both historically recent and distant, nonhumans both big and small, and environments both near and far. This criticality would interrogate the epistemology of “the human,” as an idea, and that would guide its ethico-political practices rather than reify the presumptuous conceit of a received notion of the humane.

A critique of anthropocentrism is not necessarily a critique of liberal humanism. Critics have advocated “on behalf of” animals without questioning the epistemic and material project of liberal humanism. Many critics of anthropocentrism have mistakenly perceived that the problem of our time is anthropocentrism rather than a failed praxis of being. Such critics of anthropocentrism often proceed by humanizing animals in the form of rights, welfare, and protections without questioning how advocates are constructing themselves in the process. In other words, they do not subject the very humanity they want to decenter and/or expand to sufficient interrogation. As a result, they authorize the violence of the state, one that protects, criminalizes, enforces, and prosecutes differentially based on race, class, gender, sexuality, national origin, religion, ability, and immigration status. For example, advocacy projects that seek greater legal protection for the Great Apes and more strenuous criminal prosecution for those who transgress protective laws find themselves at
odds with impoverished people in African nations that have been burdened by IMF and World Bank policies. Such nations may not be able to provide even limited protections for their human citizens and even fewer economic opportunities for the people who would be prosecuted under international animal protection legislation. An impoverished person may participate in capturing animals for pay, given that the illegal wildlife trade is the world’s second largest transnational trading industry, estimated to be worth $20 billion annually, second only to drugs. Yet, impoverished people do not gain the majority of the monetary value derived from the trade; the captured animals and the wealth generated from their labor spiral upward to the West—but not the criminal prosecution. In this context, it is not difficult to glean how such international (read: universalist) legislation drafted by exponents from more powerful and stable nations (because they continue to be imperialist) places strain on already fragile postcolonial state resources (because they continue to be colonized). One really does have to wonder what we mean by justice and rights when states and their citizens are put in such untenable positions.

At present, animal studies scholarship tends to presume a humanity that is secure within the logic of liberal humanism rather than engage with a humanity that is often cast as debatable or contingent. To render one’s humanity provisional, where the specter of nullification looms large, is precisely the work that racism does. Yet when the authors of this field speak of a human, they most commonly speak of one whose ontological integrity is assumed and idealized rather than plasticized, even when the goal of posthumanism and animal studies is ultimately to interrogate or undermine that certainty. For these fields to do accurate, fully theorized, and principled work, they must show how the question of the animal bears on the question of hierarchies of humanity. In the pages that follow, I investigate blackness’s relation to animality rather than presuppose black(ened) people’s relative power and privilege as human, vis-à-vis nonhuman animals. Thus, my work focuses on humans whose humanity is a subject of controversy, debate, and dissension in order to reveal the broader political stakes of “the animal” as a problem for contemplation.

In what follows, I hope to demonstrate that the African diaspora does indeed have a stake in overturning the production of “the animal.” However, the economies of value presumed in posthumanism and animal
studies need to be historicized and transformed, namely, the presumption that all humans are privileged over all animals by virtue of being included in humanity, or that racism is a matter of suggesting that black people are like animals based on a prior and therefore precedential form of violence rooted in speciesism. The chapters that follow are an attempt to clarify, historicize, and more precisely situate black(ened) humanity vis-à-vis animality. I engage contemporary critical theory in the fields of biopolitics, posthumanism, new materialism, and animal studies. However, my intent is to critically build on these fields’ insights, not to replicate them.

What you will find in the subsequent chapters is less a systematic critical engagement with preexisting arguments in posthumanism, the new materialisms, and animal studies and more an establishment of a different conversation on ontology with different entry points because *Becoming Human* is more interested in redefining terms than entering into preestablished ones. *Becoming Human* contends that the aforementioned fields, in the main, position blackness in the space of the unthought, and therefore are not sufficient grounds for theorizing blackness. This is not to suggest, however, that their insights hold no purchase for black studies. Departing from such a reactionary position, *Becoming Human* is instead learned and deliberative—borrowing freely from and extending these fields’ insights when and where it is useful to do so. To the extent to which *Becoming Human* does engage the fundamentals of these fields, its primary aim is to clarify how blackness conditions a given discourse. *Becoming Human* observes some crucial distinctions: there is a difference between identifying how (anti)blackness is a condition of possibility for hegemonic thought and assuming the hegemonic terms of a given discourse. Moreover, not all engagements with a given discourse are a ceding of ground but might very well be the generative unsettling of it. By placing scholarly and creative work on blackness in dialogue with posthumanism and related fields, I am able to more fully theorize the binaristic and hierarchical logics that structure relations among humans and between animals and humans. I not only show that antiblackness is actually central to the very construction of “the animal” that recent scholarship wants to interrogate and move beyond but also that (anti)blackness upends these fields’ frameworks of analysis and evaluative judgments.

*Becoming Human*’s third argument is a decisive break with a commonly held position in the study of race. I do not propose the extension
of human recognition as a solution to the bestialization of blackness. Recognition of personhood and humanity does not annul the animalization of blackness. Rather, it reconfigures discourses that have historically bestialized blackness. In the chapters that follow, forms of human recognition—including in biological conceptions of the human species and the transition from native to universal human subject in law and society—are not at odds with animalization. Thus, animalization is not incompatible with humanization: what is commonly deemed dehumanization is, in the main, more accurately interpreted as the violence of humanization or the burden of inclusion into a racially hierarchized universal humanity.

The inquiry into being and matter here does not justify itself by reproducing the specter of the flesh, of the bestial, of the passions, of nature in need of human domination. The black cultural producers in this study have chosen representational strategies that redirect modern technologies (the magazine, ink-and-paper drawing, photography, painting, the short story, and the novel) by disrupting the foundational racialized epistemological presuppositions and material histories embedded in the archive of these forms. These are technologies that have not only reflected abject animalized depictions of blackness but invented them as well. Rather than solely rehearse debates about the ideological potential or pitfalls of genres and technology, the cultural production in my study mobilizes these technologies differently, producing not only disruptive conceptions of blackness but also of ontology and epistemology more generally. African diasporic cultural production intervenes productively in reconsidering the role of “the animal” or the “animalistic” in the construction of “the human” by producing nonbinaristic models of human–animal relations, advancing theories of trans-species interdependency, observing trans-species precarity, and hypothesizing cross-species relationality in a manner that preserves alterity while undermining the nonhuman and animality’s abjection, an abjection that constantly rebounds on marginalized humans. I suggest that only by questioning rather than presupposing the virtuousness of human recognition will we be able to develop a praxis of being that is not only an alternative to the necropolitical but opposes it (Derrida, The Animal xi).

Ultimately, I suggest that the normative subject of liberal humanism is predicated on the abjection of blackness, which is not based on figurations of blackness as “animal-like” but rather casts black people as ontologi-
cally plastic. Therefore, the task before us is realizing being in a manner that does not privilege the very normativity cohered by notions of abject animality and the discursive-material plasticity of black(ened) flesh. This requires that scholars of race extend the radical questioning of “the human” established by African diasporic critics of Western humanism in a direction potentially unanticipated by prior scholarship, by interrogating the very construction of the animal beyond a condemnation of its racialized application and scope. Both critics who seek more equitable inclusion in liberal humanism and those who pursue a radical transformation of the normative category of “the human” have commonly overlooked the centrality of the animal question for black existential matters. Becoming Human extends the insights of African diasporic critics of “the human” by demonstrating that key texts in black cultural production move beyond a demand for recognition and inclusion in the very normative humanity that theorists such as Frantz Fanon, Lewis Gordon, Saidiya Hartman, Hortense Spillers, Fred Moten, Aimé Césaire, Sylvia Wynter, Frank Wilderson III, Katherine McKittrick, Christina Sharpe, Denise Ferreira da Silva, Achille Mbembe, and Alex Weheliye have shown is fundamentally antiblack, while also calling into question the presumptive logic undergirding the specter of animalization.18

The cultural production examined here spans three continents and three centuries because antiblackness has been central to establishing national borders and readily crosses them. Antiblackness has also been diasporically challenged and refused, making it central to what comprises the very notion of the African diaspora and of blackness. It is precisely through rather than against historically demarcated regional, national, linguistic, and state preoccupations that this discourse cyclically reorganizes itself. Antiblackness's pliability is essential to the intransigent, complementary, and universalizing impetus of antiblack paradigms. Irrespective of the innumerable and ever-transient definitions of black identity across the diaspora, which by definition are ephemerally produced, all black(ened) people must contend with the burden of the antiblack animalization of the global paradigm of blackness, which will infringe on all articulations and political maneuverings that seek redress for present and historical violence.

Within the structure of much thought on race there is an implicit assumption that the recognition of one as a human being will protect one
from (or acts as an insurance policy against) ontologizing violence. Departing from a melancholic attachment to such an ideal, I argue that the violence and terror scholars describe is endemic to the recognition of humanity itself—when that humanity is cast as black. A recognition of black humanity, demonstrated across these pages, is not denied or excluded but weaponized by a conception of “the human” foundationally organized by the idea of a racial telos. For Wynter, the Negro is not so much excluded from the category Man and its overrepresentation of humanity but foundational to it as its antipodal figure, as the nadir of Man. I argue that the recognition of humanity and its suspension act as alibis for each other’s terror, such that the pursuit of human recognition or a compact with “the human” would only plunge one headlong into further terror and domination. Is the black a human being? The answer is hegemonically yes. However, this, in actuality, may be the wrong question as an affirmative offers no assurances. A better question may be: If being recognized as human offers no reprieve from ontologizing dominance and violence, then what might we gain from the rupture of “the human”?

Animalization is a privileged method of biopolitical expression of antiblackness; however, historians’ and theoreticians’ response to the centrality of animalization has been inadequate, as scholars have misrecognized the complexity of its operations. Binaristic frameworks such as “humanization versus dehumanization” and “human versus animal” are insufficient to understand a biopolitical regime that develops technologies of humanization in order to refigure blackness as abject human animality and extends human recognition in an effort to demean blackness as “the animal within the human” form. This is not to say that expressions and practices of antiblackness never radically exclude black people from the category of “the human”; rather, the point is that inclusion does not provide a reliable solution because, in the main, black people have been included in (one might even say dominated by) “universal humanity”—but as the incarnation of abject dimensions of humanity for which “the human” is foundationally and seemingly eternally at war. Thus, black people are without shelter, whether invited into or locked out of “the human.”

I seek to investigate black revisionist and counter-discursive practices in the context of liberal humanism’s selective and circumscribed recognition of humanity in black people. While black people cannot simply opt out of humanism, as liberal humanism is the primary mode of recognition in
the global historical present, nevertheless, I argue that the severe limitations of liberal humanism and notions of “the human,” the conscripting humanity imputed to black people, has led to a radical questioning of “the human,” and in particular the status assigned to animality, in key works of black cultural expression. This questioning is suggestive of a desire for, perhaps, a different “genre of the human” or may even signal, as I propose, an urgent demand for the dissolution of “human” but, in either case, is not simply a desire for fuller recognition within liberal humanism’s terms (Wynter and Scott 196–197).

Making Humans: Animalization as Humanization

Everything happens as if, in our culture, life were what cannot be defined, yet, precisely for this reason, must be ceaselessly articulated and divided.
—Giorgio Agamben, The Open

No, they were not inhuman. Well, you know, that was the worst of it—this suspicion of their not being inhuman. It would come slowly to one. They howled and leaped, and spun, and made horrid faces; but what thrilled you was just the thought of their humanity—like yours—the thought of your remote kinship with this wild and passionate uproar.
—Joseph Conrad, Heart of Darkness

The uncompromising nature of the Western self and its active negation of anything not itself had the counter-effect of reducing African discourse to a simple polemical reaffirmation of black humanity. However, both the asserted denial and the reaffirmation of that humanity now look like two sterile sides of the same coin.
—Achille Mbembe, On the Postcolony (emphasis in original)

As Achille Mbembe in On the Postcolony observes, discourse on Africa “is almost always deployed in the framework (or on the fringes) of a meta-text about the animal—to be exact, about the beast: its experience, its world, and its spectacle” (2). During the eighteenth and nineteenth
centuries Western philosophy’s architects, figures such as Hume, Hegel, Jefferson, and Kant, constructed a theory of blackness’s inherent animality based on either “the African’s” purported physical or mental likeness to nonhuman animals, or as a result of the underdeveloped condition of African humanity. The former relied on the establishment of “laws of nature” whereby Africans and animals found on the African continent developed similar deficiencies based largely on geographical determinants. In such a model, privileging human–animal comparison, the environment itself is black(ened), and its inferiority in turn stymies African humanity. Thus, African peoples qualify as human but only tentatively so, given their purported physical or mental similarity to nonhuman animals and vice versa. In the latter case, a developmental model, humanity is marked as an achievement and teleology. Here “the African,” while also human, is nevertheless defined by their animality. Rather than being animal-like, black people are animals occupying the human form. The two positions have different routes but the same destination: in short, black(ened) people are the living border dividing forms of life such that “the animal” is a category that may apply to animals and some humans. Thus, the category of “the animal” develops in a manner that crosses lines of species. Furthermore, in either case, in the process of animalizing “the African,” blackness would be defined as the emblematic state of animal man, as the nadir of the human. By virtue of racialization, the category of “the animal” could even potentially racialize animals in addition to animalizing blackness. The debate over whether blackness is a subspecies of the human or another type of being altogether haunted scientific debates concerning “monogenesis versus polygenesis.” However, the line between these two approaches is only partially maintained in the thinkers discussed across this book’s pages. It is not always clear, not only on what side of the border “the African” is placed, but also the total number of borders posited at any given point in this debate. What is certain, though, is that monogenesis or racially inclusive constructions of “the human” complemented rather than detracted from animalized depictions of blackness. Such debates were instrumental in codifying and institutionalizing both popular and scientific perceptions of race. There are too many examples to enumerate them all—but in the following, I have chosen what I believe are the most cited cases.
Much of this history is known; it is commonly referred to in critiques of humanism that advance a conception of “dehumanization,” in which dehumanization is treated as sufficient shorthand for humanist thought (especially Enlightenment thought) concerning blackness. Enlightenment is a multivocality with contradiction and moving parts, and thus not reducible to its more infamous ideas. However, this section reinterprets a powerful and ever-present strand of racist Enlightenment thought. After careful investigation, I have come to some new conclusions that inform the chapters that follow: First, I replace the notion of “denied humanity” and “exclusion” with bestialized humanization, because the African’s humanity is not denied but appropriated, inverted, and ultimately plasticized in the methodology of abjecting animality. Universal humanity, a specific “genre of the human,” is produced by the constitutive abjection of black humanity; nevertheless, the very constitutive function of this inverted recognition reveals that this black abjection is transposing recognition, and an inclusion that masks itself as an exclusion. Second, blackness is not so much derived from a discourse on nonhuman animals—rather the discourse on “the animal” is formed through enslavement and the colonial encounter encompassing both human and nonhuman forms of life. Discourses on nonhuman animals and animalized humans are forged through each other; they reflect and refract each other for the purposes of producing an idealized and teleological conception of “the human.” Furthermore, antiblack animalization is not merely a symptom of speciesism; it is a relatively distinctive modality of semio-material violence that can be leveraged against humans or animals (Singer 6, 18, 83). Similarly, speciesism can be mobilized to produce racial difference. Thus, the animalizations of humans and animals have contiguous and intersecting histories rather than encompassing a single narrative on “animality.” This is a crucial point, as it allows us to appreciate the irreducibility of both antiblackness and species as well as investigate the respective semio-material trajectories of black(ened) bodies and nonhuman animal bodies take in their historical and cultural specificity.

Hume extrapolated from his understanding of the natural environment that “inferior” climates produce “inferior nations.” He believed that if plants and “irrational” animals were influenced by degree of heat and cold, then the character of humans must also be influenced by air and climate. These environmental factors rendered minds “incapable of
all the higher attainments of the human mind,” which prompted him to “suspect negroes and in general all other species of men to be naturally inferior to the whites . . . No ingenious manufactures amongst them, no arts, no sciences” (Hume 125n). He went as far as to infamously declare, “In Jamaica, indeed, they talk of one negro as a man of parts and learning; but it is likely he is admired for slender accomplishments, like a parrot who speaks a few words plainly” (Hume 213). Hume, like most Enlightenment thinkers mentioned here, accepted the Aristotelian conception of the human as an animal, but what marked human's uniqueness, according to Aristotle, was rationality.22 The human was a “rational animal.” Thus, humanity was not defined in strict opposition to “the animal,” but one’s humanity was determined by the nature of one’s rationality. For Hume, in the case of African rationality, it was either deficient or negligible. Therefore, the humanity of the Negro “species of men” was acknowledged, but in a hierarchical and taxonomical frame.

Kant, like Hume, looked to “the animal kingdom” as an analogue for humanity, but what is astonishing is the manner in which his articulations of “species” and “race” are interdependent and concentric epistemological constructions. Whether in the work of Carl Von Linne, Georges-Louis LeClerc, Comte de Buffon,33 or in the following statement by Kant, animal and human “race” are co-articulations:

Among the deviations—i.e., the hereditary differences of animals belonging to a single stock—those which, when transplanted (displaced to other areas), maintain themselves over protracted generation, and which also generate hybrid young whenever they interbreed with other deviations of the same stock, are called races. . . . In this way Negroes and Whites are not different species of humans (for they belong presumably to one stock), but they are different races, for each perpetuates itself in every area, and they generate between them children that are necessarily hybrid, or blendings (mulattoes). (17)

In such formulations, there is much anxiety about maternity and sexual difference. It is difficult to maintain that either the logic of raciality or the animalization of blackness is merely symptomatic of attempts to domesticate “nature” or “animals” under an ordering system. Rather, the
demand for taxonomical and hierarchical races is foundational to the project of assimilating newly “discovered” plants and nonhuman animals into a system, as the vastness of nature would overwhelm and exceed the limits of the time and location’s reigning epistemological frame (but not its appetite for mastery). Race can only be subsidiary to the desire to animalize nonhuman animals or make “nature” knowable if one abstracts this desire from its historical context: “The Age of Discovery,” which is to say the age of slavery and conquest.

If, as Foucault maintains in *The Order of Things*, our current hegemonic, “universalist” conception of “man” is a mutation of prior metaphysical conceptions of being, then I would qualify this insight by insisting that this mutation was and remains an effect of slavery, conquest, and colonialism. The metaphysical question of “the human,” as one of *species* in particular, arose through the organizational logics of racialized sexuation and the secularizing imperatives (largely economic, but not exclusively so) of an imperial paradigm that sought dominion over life, writ large. At the meeting point of natural philosophy and the so-called Age of Discovery, natural science instituted its representational logics of somatic difference in ever-increasingly secularized ontological terms.

Hegel represents perhaps the most extreme articulation of “the African’s” animality, one in which animality is thought not only to be a feature, but *the essence* of African life. At times, from reading Hegel’s (and arguably Kant’s) geographical theories, one could conclude that his theory of nature and animals is animated by a desire to fix race as teleological hierarchy: to make race knowable and predictable. For Hegel declares:

> Even the animals show the same inferiority as the human beings. The fauna of America includes lions, tigers, and crocodiles. But although they are otherwise similar to their equivalents in the Old World, they are in every respect smaller, weaker, and less powerful. (163)

In this case, it is not the native’s likeness to animals that defines human animality; instead animals’ likeness to American Indians defines animals in their animality. The quality of American Indian being becomes the term through which “nature” is defined. This is not to say that his
thoughts on nonhuman animals are merely a justification for his theories of race, but rather it does demonstrate that we cannot assume that racism does not animate conceptions of some of our most foundational theories of nature and nonhuman animality. Most of the humanist thought discussed here was developed during the eighteenth and nineteenth centuries when the slave trade was increasingly under scrutiny by abolitionists. Contestation had risen to unprecedented levels, and as a result, slavery increasingly required justification (Jordan 27, 231–232). These justifications relied heavily on the African's purported animality. Even Georges Leopold Cuvier’s classification of humanity into three distinct varieties—Caucasian, Mongolian, and Ethiopian—emphasized the superiority of the Caucasian and is elaborated in his book titled Animal Kingdom (Cuvier 50).

In Notes on a State of Virginia, Thomas Jefferson attempts to qualify the essence of black people’s humanity. What is crucial is that Jefferson defines black people as “animal” not based on a direct correlation to nonhuman animals but on the specificity of black people’s humanity, particularly with regard to black embodiment, sexuality, intelligence, and emotions: aesthetically displeasing form, bestial sexuality, and minor intelligence and feeling. Regarding the heart and mind, he states:

They are more ardent after their female; but love seems with them to be more an eager desire, than a tender delicate mixture of sentiment and sensation. Their griefs are transient. Those numberless afflictions, which render it doubtful whether heaven has given life to us in mercy or in wrath are less felt, and sooner forgotten with them. (Jefferson 46)

Jefferson’s arguments recognize black humanity, but the question is what kind of humanity is imputed to black(ened) people? As he states, “It is not against experience to suppose, that different species of the same genus, or varieties of the same species, may possess different qualifications” (Jefferson 151).

Following Aristotle, humanity and animality are not mutually exclusive terms in much Eurocentric humanistic thought—however, there is an important qualification: the logic of conquest, slavery, and colonialism produced a linear and relational conception of human animality. Whereas Europeans are moral/rational/political animals, the recogni-
tion of black people’s humanity did not unambiguously and unidirectionally elevate black people’s ontologized status vis-à-vis nonhuman animals. “Being human” instead provided a vehicle for reinforcing a striated conception of human species. Thus, the extension and recognition of shared humanity across racial lines is neither “denied” nor mutual, reciprocal human recognition; rather, it is more accurately deemed bestializing humanization and inverted recognition. Instead of denying humanity, black people are humanized, but this humanity is burdened with the specter of abject animality. In fact, all of the thinkers above identify black people as human (however attenuated and qualified); thus, assimilation into the category of “universal humanity” should not be equated with black freedom. Assimilation into “universal humanity” is precisely this tradition’s modus operandi. But what are the methods? And what are the costs?

Too often, our conception of antiblackness is defined by the specter of “denied humanity” or “exclusion.” Yet as Saidiya Hartman has identified in *Scenes of Subjection: Terror, Slavery, and Self-Making in Nineteenth-Century America*, the process of making the slave relied on the abjection and criminalization of slave humanity, rather than the denial of it. Hartman asks:

> suppose that the recognition of humanity held out the promise not of liberating the flesh or redeeming one’s suffering but rather of intensifying it? Or what if this acknowledgment was little more than a pretext for punishment, dissimulation of the violence of chattel slavery and the sanction given it by the law and the state, and an instantiation of racial hierarchy? What if the endowments of man—conscience, sentiment, and reason—rather than assuring liberty or negating slavery acted to yoke slavery and freedom? Or what if the heart, the soul, and the mind were simply the inroads of discipline rather than that which confirmed the crime of slavery. (5)

Hartman contends that the recognition of the enslaved’s humanity did not redress slavery’s abuses nor the arbitrariness of the master’s power since in most instances the acknowledgment of the humanity of the enslaved was a “complement” to the arrangement of chattel property rather than its “remedy”(6). She demonstrates that recognition of the
enslaved’s humanity served as a pretext for punishment, dissimulation of chattel slavery’s violence, and the sanction given it by the law and the state (Hartman 5). What’s more, rather than fostering “equality,” this acknowledgment often served as an instantiation of racial hierarchy, as the slave is “recognized” but only as a lesser human in (pre)evolutionist discourse or criminalized by state discourses. In other words, objecthood and humanization were two sides of the same coin, as ties of affection could be manipulated and will was criminalized.

The enslaved bifurcated existence as both an object of property and legal person endowed with limited rights, protections, and criminal culpability produced a context where consent, reform, and protection extended the slave’s animalized status rather than ameliorated objectification. From this perspective, emancipation is less of a decisive event than a reorganization of a structure of violence, an ambivalent legacy, with gains and losses, where inclusion could arguably function as an intensification of racial subjection. Echoing Hartman, I would argue for reframing black subjection not as a matter of imperfect policy nor as evidence for a spurious commitment to black rights (which is undeniably the case) but rather as necessitating a questioning of the universal liberal human project. “The human” and “the universal” subject of rights and entitlements assumed a highly particularized subject that is held as paradigmatic, subjugating all other conceptions of being and justice. Furthermore, if the following assertion by Achille Mbembe is correct, “the obsession with hierarchy . . . provides the constant impetus to count, judge, classify, and eliminate, both persons and things” in the name of “humanizing” the colonized, I ask, how can we confidently distinguish humanization from animalization (Mbembe 192)? What we have at hand is more complicated than a simple opposition such as “exclusion versus inclusion,” “the human” versus “the animal,” and “humanization versus dehumanization.” Consequently, a new epistemology and transformative approach to being is needed rather than the extension of human recognition under the state’s normative conception.

As long as “the animal” remains an intrinsic but abject feature of “the human,” black freedom will remain elusive and black lives in peril, as “the animal” and “the black” are not only interdependent representations but also entangled concepts. While there are particular Euroanthropocentric discourses about specific animals, just as there are particular
forms of antiblack racialization based on ethnicity, gender, sexuality, and national origin, for instance, these particularizing discourses are in relation to the organizing abstraction of “the animal” as “the black.” To disaggregate “humanity” from the production of “black humanity,” the one imposed on black(ened) people, assumes one could neutralize blackness and maintain the human’s coherence. But the neutralization of blackness requires the dissolution of discourses on “the animal” and vice versa, but that is, to say the least, unlikely because “the animal” is a mode of being for which Man is at war. What is more plausible is that attempts to neutralize blackness and “the animal” will continue to be in practice, if not word, a means of discipline and eradication.

When humanization is thought to be synonymous with black freedom, or even a means to freedom, one risks inadvertently minimizing or extending the violence of “universal humanity.” The “universal” is a site of imperial imposition and constant contestation rather than simply an ideal. The ongoing process of universalization is purchased precisely through the abjection and ontologizing plasticization of “the African.” As Hegel argued, Africans are barred from universal humanity or spirit because they are not aware of themselves as conscious historical beings, a consequence of two intrinsic qualities. First, Africans worship themselves or nature rather than God. Second, Africans kill their king, which is a failure to recognize the superiority of a higher authority than themselves, whether that of God or law.

The African character, according to Hegel, springs from a geographical climate hostile to the achievement of spirit. Hegel builds on earlier theories that suggest that climate is not simply fertile ground for the cultivation of nature but is also the root of a teleological human character. He believed the “torrid” and “frigid” zones, “where nature is too powerful,” do not provide the sufficient conditions for the dialectic of becoming, or the attainment of “freedom by means of internal reflection,” whereby humanity is achieved in opposition to nature (Hegel 154). One achieves spirit by rising above nature, distinguishing oneself from one’s natural surroundings. Only by passing through this stage is one able to recognize the presence of God as separate from the self and above Nature. Thus, God “exists in and for itself as a completely objective and absolute being of higher power” determining the course of everything in nature and humanity (Hegel 178). Hegel declares, “The Negro is an example of animal
man in all his savagery and lawlessness” and the African’s “primitive state
of nature is in fact a state of animality” (177, 178).

The practice whereby Africans “worship the moon, the sun, and the
rivers,” animating these natural forms “in their imagination, at the same
time treating them as completely independent agents,” Hegel believes, ul-
timately makes the mistake of identifying nature’s power without identi-
ifying that nature has an eternal law or providence behind it, providing
universal and permanent natural order (Hegel 178). The African’s “arbi-
trariness” triumphs over permanent natural order. Thus, the African is not
able of the rational universality embedded in the concepts of law, eth-
ics, and morality. As free rational laws are, for Hegel, the bases of freedom,
Hegel formulates most systematically a conception of “the African” that
is both of humanity but not in humanity. Thus, humanity is not strictly
a biological imperative but a cultural achievement in Hegelian thought.

Hegel pronounces “the African” an animal precisely through the re-
jection of African political and spiritual rationality, even while denying
the existence of African rational capability altogether. One must ask,
how can one deny the presence of African rationality through a method
that acknowledges its existence? And, to what extent is black humanity
“excluded” when it is central to the construction of European humani-
ity as an achievement? Infamous pronouncements aside, Hegel’s con-
clusion is circular: his logic collapses against the weight of his precepts
and method. This circuitous logic is one we inherit when a difference in
Reason is interpreted as absence or chaos.

As Mbembe notes in On the Postcolony, the problem of universal hu-
manity shapes current conditions of ethics and justice:

Each time it came to peoples different in race, language, and culture, the
idea that we have, concretely and typically, the same flesh, or that in Hus-
serl’s word, “My flesh already has the meaning of being a flesh typical
in general for us all,” became problematic. The theoretical and practical
recognition of the body of “the stranger” as flesh and body just like mine,
the idea of a common human nature, a humanity shared with others, long
posed, and still poses, a problem for Western consciousness. (2)

Hegel’s theory of “universal humanity” has influenced the culture of
rights and law, including human rights law, but at the cost of erasing
competing conceptions of being and justice that are not rooted in the opposition between Man and Nature.

A conception of humanity that Hegel dismissed as “nature-worship” animates the work of famed South African artist Ezrom Legae, in particular his *Chicken Series* (Hegel 133). Legae created artworks in ink and pencil as well as totemic bronze sculptures (Figure P.1). In 1977, Legae expressed his feelings about the gunned-down child protesters during the Soweto uprising and the murder of Bantu antiapartheid leader Steve Biko at the hands of the police through chiaroscuro, a set of pencil and ink drawings. In *Biko’s Ghost*, Shannen Hill asserts that the *Chicken Series* remains among two of the best known of all works that explore Steve Biko’s death (116). A medium that mobilizes the polarity of black:white, by mixing light and substance, according to Richard Dyer, chiaroscuro can become a key feature of the representation of white humanity as translucence: privileging the “radiant white face” and obscuring “the opaque black one,” “which is at the very least consonant with the perceptual/moral/racial slippages of western dualism” (115–116). Channeling Anne Hollander, Dyer argues that chiaroscuro is a technique used to “discipline, organize and fix the image, suggesting the exercise of spirit over subject matter” (Dyer 115). If, as Dyer suggests, chiaroscuro “allows the spiritual to be manifest in the material” because it selectively lets light through, Legae’s subversion, his chiaroscuro’s representation of spirit, bends the semiotics of the Christian West and black South Africa in a direction that calls for the overthrow of (state) hierarchies of race and “the human” rooted in polarities of the enlightened and benighted.27

In the drawings, there are fragile domestic fowls and human–bird hybrids: broken bones, battered, impaled, crucified, fragmented, and swollen. Tortured bodies are alongside eggs, figures of renewal. The drawings collectively speak to the torture, sacrifice, and regeneration of South Africa’s Black Consciousness movement.

As John Peffer notes, in terms of its manifest content, the image is that of Christian martyrdom: a crucified chicken. However, the animal aspect is not simply a metaphor for the pained existence of human life under the rule of apartheid; it also illustrates the animal potential of the human. This felt conception of humanity’s animal potential is rooted in a cosmological system, a philosophy where the potency of animals may be shared with humans. Humans, especially those who are spiritually
powerful, such as community leaders or healers, harness the spiritual and even physical characteristics of animals. For South Africans such as Legae, those depicted in his work are no longer simply human, as they are transformed by the taking on of the physical and psychical potential of animals. Thus, they are not merely metaphorically animals, but are altered in a physical and psychical sense. His work is a challenge to Manichean distinctions between the physical and the spiritual as well as “human versus the animal” (Peffer 58–59).

When the prevailing notion of (human) being becomes synonymous with “universal humanity” or “the human” in discourses of law and popular consciousness, this is an outcome of power, whereby one worldview is able to supplant another onto-epistemological system with a different set of ethical possibilities. The more “the human” declares itself “universal,” the more it imposes itself and attempts to crowd out correspondence across the fabric of being and competing conceptions of being. The insistence on the universality of “the human” allows for the multiplication and proliferation of this abstraction’s aggression. To overcome a competing model, Western humanism has historically harnessed the force of the state; not only does this take the form of direct state violence, but it is also accomplished by epistemic erasure. Attacks on indigenous forms of knowledge are essential to the process of normalizing a colonial episteme. In bids for recognition and legibility of suffering, within national and global judicial bodies, one’s legal identity and injury must speak the language of a particular philosophy of the human. This is so despite the fact that universal humanity, as defined by Hegel and taken up in liberal humanist judicial bodies, is rooted in an anti-African epistemology.

However, under the circumstances, Legae’s protest did benefit, to an extent, from its opacity and incommensurability with respect to the state’s conception of the human, as its critique was obscured from the state. Its cosmological codes, its animating conception of humanity, were rendered illegible by the same force of law that sparked his outrage and grief. However, what was opaque to the state was immediately identifiable to South Africans like himself. The current conception of universal humanity does not move beyond a Western, secularized cultural mode and thus misrecognizes and occludes African subjectivity. Thus, we cannot take universal humanity at its word that it is indeed “universal.” Hegel’s
conception of universal humanity aggressively negates Legae’s conception of being and world. Namely, Hegel’s humanism disregards the rationality, reflexivity, and abstract reasoning and idiom of representation that constitute Legae’s vitalizing mode of insubordination. According to Hegel, such a considered act could never spring from “nature-worship” cosmological worldviews (133).

Ironically, the manner in which “the human” announces its universality provides the occasion for Legae’s protest to slip under the radar of the apartheid South African government and elude censorship. Evoking the latent animal potential of those brutalized by the state’s violence, an alternative mode of being (human) and attendant to spirit, the Chicken Series bypasses the problem of the representationalism and its historical reification of the traumatized black body. Thus, Legae could provide powerful witness to events barred from public discourse by an apartheid government, challenging apartheid state terror overtly (opaque). His conception of being, or ontology, defends indigenous African life from the encroachment of a humanism that universalizes itself through torture and intimidation, yes, but also via imperial epistemology, ontology, and ethics. Considering that much of the world does not adhere to a worldview guided by human–animal binarism nor is legible within these terms, I wonder what other modes of relating, epistemologies of being, and ethical possibilities exist beyond the horizon of “the human” and “the animal”?

Some believe, like Lewis Gordon, that black people must be humanists for the “obvious” reason, that the dominant group can “give up” humanism for the simple fact that their humanity is presumed, while other communities have struggled too long for the “humanistic prize” (Gordon 39–46). But what if the enslaved and colonized “no longer accept concepts as gift, nor merely purify and polish them, but first make and create them, present them and make them convincing?” (Nietzsche 409). The elusive “humanist prize”—the formal, symmetrical extension of European humanism—makes achieving its conception of “the human” a prerequisite of equitable recognition, yet its conception of humanity already includes the African, but as abject, as plastic. Thus, in order to become human without qualification, you must already be Man in its idealized form, yet Man, understood simultaneously as an achievement and bio-ontology, implies whiteness and specifically nonblackness.
We misdiagnose the problems of Western globalizing humanism when we take universalism at its word, seeing its failures as simply a problem of implementation or procedure. This results in a further misdiagnosis of the causes and outcomes of freedom and unfreedom. Freedom itself is an evolving practice rather than a normative ideal (D. Roberts, *Killing* 183). As an ideal, freedom is shielded from critique by alternative conceptions rooted in another order of being/knowing/feeling. That said, I also believe that we have misrecognized the refractory desires of black culture, which are commonly not to assimilate but to transform.

After Man

In the Enlightenment thought mentioned above, “the African” is a discourse that develops out of the specific historical context of slavery and expansionism beyond the so-called temperate zones, an expansion into what came to be called Africa and the Caribbean. The discourses that developed to narrate Africa as a land of abject bestial humanity spiraled out and sought to take possession of all African diasporic peoples beyond the geo/ethno/linguistic specificities of “the African” and “the Hottentot.” As Mbembe puts it, “What we have said about the slave also holds for the native. From the point of view of African history, the notion of the native belongs to the grammar of animality” (236). Thus, while the black thinkers in *Becoming Human* were born in different nations—South Africa, Cuba, Kenya, the United States, among others—all must define themselves in a globalizing antiblack order that raises “the animal question” as ultimately an existential one.

In this project, I am interested in how African diasporic writers and artists not only critique animalization but also exceed critique by overturning received ontology and epistemic regimes of species that seek to define blackness through the prism of abject animality. By doing so, they present possibilities that point our attention to the potential of modes of worlding that are more advantageous to life writ large. I home in on the epistemic locations of science and philosophy not only because these are the sites that have continued to be privileged in a contest over meaning and truth but also because the questions pursued in *Becoming Human* are biocultural, or more precisely sociogenic: they concern the ways that we are Homo Narrans, both bios and mythos. Instead of aiming for a com-
prehensive approach to African diasporic perspectives on the so-called animal question, this study does not claim to be all-inclusive, but it does claim that the strategies examined here offer a set of cases that enlarge the field of being’s possibility beyond antiblack ontological plasticity. They initiate what appears impossible and create that which is to come.

In Habeas Viscus, Alexander Weheliye maintains, “The greatest contribution to critical thinking of black studies—and critical ethnic studies more generally—is the transformation of the human into a heuristic model and not an ontological fait accompli” (8). Becoming Human’s contribution to this effort is its concept of plasticity, which maintains that black(ened) people are not so much as dehumanized as nonhumans or cast as liminal humans nor are black(ened) people framed as animal-like or machine-like but are cast as sub, supra, and human simultaneously and in a manner that puts being in peril because the operations of simultaneously being everything and nothing for an order—human, animal, machine, for instance—constructs black(ened) humanity as the privation and exorbitance of form. Thus the demand placed on black(ened) being is not that of serialized states nor that of the in-between nor partial states but a statelessness that collapses a distinction between the virtual and the actual, abstract potential and situated possibility, whereby the abstraction of blackness is enfleshed via an ongoing process of wresting form from matter such that raciality’s materialization is that of a dematerializing virtuality.

What sets Becoming Human apart is the manner in which it takes seriously that black literary and visual culture theorizes and philosophizes. While certainly highlighting historical and contemporary individual black philosophical thinkers, this project is equally interested in the philosophical thought that occurs in/as expressive culture. Given that, historically, black people have, in the main, been excluded from the more recognized domains of politics, religion, and philosophy, I maintain that black arts and letters has often been a key site for philosophy, theology, and political theory. Becoming Human acknowledges the historical and ongoing exclusions of black people from the domain of the “properly” theoretical and philosophical, but in what follows, you will not find an effort justifying or trying to convince anyone that black thought has something to say about European Continental thought and it is valuable to do so; it just gets on with the work of reading black arts.
and letters philosophically. Such a reading is not content with reading a novel or poem or work of visual art as mere example of the ideas of an individual “great” thinker; rather, in reading literature and visual art for theory, the approach is that of placing the theories of/as literary and visual art in conversation with more recognizable means and forms of philosophy. It is not an attempt to be exhaustive or comprehensive rather it takes aim at assumptive logics by disrupting and reconstellating the frame through which we have come to question blackness’s relation to Man, particularly as it pertains to “the animal” and “species.” Thus, the aim is to establish new entry points into the conversation about the nature of the problem and point to other horizons rather than purport to exhaust the monumental question of race and “the human.” Subscribing to the view all is present, when it comes to modern blackness, *Becoming Human*—while historically situating and contextualizing “theory”—has the principal intention of depth in its critical aims rather than producing the effects of the historian.

The modes of being examined in *Becoming Human* do not advocate a politics based on rights and entitlements under the law, precisely because their forms are undergirded by demands that are either criminalized, pathologized, or simply rendered illegible by law and the normative mode of “the human”; these demands emerge from a different way of being/knowing/feeling existence than the ones legible and codified in law and the dialectics of Man. Their contestation invests in speculation and expressive culture as a site of critique and creativity. They put forth transient and fleeting expressions of potentiality in the context of the incongruity between substantial freedom and legal emancipation as well as that of colonialism and decolonization. These gestures of potentiality are often incomplete but point to a desire and world-upending claim that is not currently recognized in the social orders that gave rise to them. Each chapter of *Becoming Human* engages a different aspect of what it is to problematize the category of Man from that space that has been foreclosed in order for the category to exist.

The arc of *Becoming Human* starts with the grounding reference of slavery. It puts forward the theory of ontologized plasticity based on reading across Frederick Douglass’s 1845 *Narrative* and 1873 speech on “Kindness to Animals” and Toni Morrison’s *Beloved* for their respective elaboration and philosophical interventions into the idea of the Chain
of Being and its racialization of the human–animal distinction. Next, it examines the concept of “the world,” by reading Nalo Hopkinson’s genre-defying and literary philosophical *Brown Girl in the Ring* for its upending of Heideggerian metaphysics, in particular Heidegger’s highly influential tripartite system of human, animal, and stone, through the text’s allegorical examination of the matter of black women’s being in the world. *Becoming Human* then turns to a reading of Octavia Butler’s “Bloodchild,” a text that deconstructs the racialized gendered and sexual imaginary of body and self, accompanying scientific debates about the origin of life itself and symbiosis, a theory of cross-species evolutionary association. Finally, *Becoming Human* concludes with Wangechi Mutu’s *Histology of the Different Classes of Uterine Tumors* and Audre Lorde’s *The Cancer Journals*; Mutu’s visual art and Lorde’s journals bring to the forefront the problem of antiblackness, in the mode of a discourse of species, and its role in reproductive health disparity. *Becoming Human* closes with a coda that initiates a black feminist theory of the necropolitical. The last two chapters and coda concern the pertinence of the biopolitics of antiblackness to historically recent and contemporary theories of biological discourse and species. However, all of the texts in my study underscore the recursive trajectory of discourses on black animality.

Chapter 1, “Losing Manhood: Plasticity, Animality, and Opacity in the (Neo)Slave Narrative,” is introduced by Frederick Douglass’s provocation from his 1845 *Narrative*, “You have seen how a man was made a slave; you shall see how a slave was made a man” (389). Slavery, in particular the slave narrative, established the terms through which we commonly understand the bestialization of blackness. Douglass’s 1845 *Narrative* has been central to interpretations that read African American literature through the framework of a petition for human recognition. Douglass, himself, arguably the nineteenth century’s most iconic slave, grounds his critique of slavery in natural law. However, Douglass’s later speeches problematize his commitment to the natural rights tradition found in his 1845 *Narrative*, by disrupting its racially hierarchical conception of being and challenging the animal abjection that is foundational to its ontology.

*Beloved* recalls rhetorical strategies, such as appeals to sentimentality and the sovereign “I” employed by Frederick Douglass, that diagnose
racialization and animalization as mutually constitutive modalities of domination under slavery. Chapter 1 examines how we might read Morrison as productively problematizing sentimentality as well as gendered appeals to discourses of the Self rooted in religio-scientific hierarchy, specifically the scala naturae or Chain of Being, as both discourses have historically recognized black humanity and included black people in their conceptualization of “the human,” but in the dissimulating terms of an imperial racial hierarchy. Beloved extends Douglass’s intervention by subjecting animality’s abjection to further interrogation by foregrounding nonhuman animal perspective, destabilizing the epistemological authority of enslaving modernity, including its gendered and sexual logics. By doing so, Beloved destabilizes the very binaristic and teleological epistemic presumptions that authorize the black body as border concept. Re-constellating the slave narrative genre, Morrison opens up a new way to interpret the genre, not as one that exposes slavery’s dehumanization but rather as one that meditates on the violence of liberal humanism’s attempts at humanization. Unsettling calcified interpretations of history and literary slave narratives, Beloved identifies the violation of slavery not in an unnatural ordering of man and beast but in its transmogrification of human form and personality as an experiment in plasticity and its limits therein, while also exploring what potential opacity holds for a generative disordering of being.

Chapter 2, “Sense of Things: Empiricism and World in Nalo Hopkinson’s Brown Girl in the Ring,” is a reading of Nalo Hopkinson’s 1999 Locus Award–winning near-future novel Brown Girl in the Ring. Becoming Human avers that gendered antiblack metaphysics continues to subtend scales of world among humans, animals, and objects in Heidegger’s still highly influential thought despite being imagined as a corrective to previous scales, such as the scala naturae or the Chain of Being examined in chapter 1. It explores what other sense of world becomes available in spaces of abjection and the unthought. Martin Heidegger once wrote regarding the relation between thought and being: “[1.] the stone (material object) is worldless [weltlos]; [2.] the animal is poor in world [weltarm]; [3.] man is world-forming [weltbildend]” (Fundamental 177). Chapter 2 argues that the absent presence of the black female figure functions as an interposition that subtends and therefore paradoxically holds the potential to topple the logic of this schema and investigates how, as a con-
sequence of this system’s imperialist worldmaking and monopolization of sense, the matter of the black female body is vertiginously affected. An inquiry into onto-epistemology, this chapter explores the reciprocal production of aesthesis and empiricism, both the seemingly scientific and the perceptual knowledge that signify otherwise under conditions of imperial Western humanism.

I argue that as an enabling condition of an imperial Western humanist conception of the world as such, the black mater(nal) marks the discursive-material trace effects and foreclosures of the dialectics of hegemonic common sense and that the anxieties stimulated by related signifiers, such as the black(ened) maternal image, voice, and lifeworld, allude to the latent symbolic-material capacities of black mater, as mater, as matter, to destabilize or even rupture the reigning order of representation that grounds the thought–world relation. In other words, the specter of black mater—that is, nonrepresentability—haunts the terms and operations tasked with adjudicating the thought–world correlate or the proper perception of the world as such, including hierarchical distinctions between reality and illusion, Reason and its absence, subject and object, science and fiction, speculation and realism, which turn on attendant aporias pertaining to immanence and transcendence. Exploring the mind-body-social nexus in Hopkinson’s fiction, I contend that in Brown Girl in the Ring, vertigo is evoked as both a symptom and a metaphor of inhabiting a reality discredited (a blackened reality) that is at once the experience of the carceral and the apprehension of a radically redistributed sensorium. I argue that black mater holds the potential to transform the terms of reality and feeling, therefore rewriting the conditions of possibility of the empirical.

While remaining attentive to the role of the scientific in the philosophical and the philosophical in scientific throughout, the second half of Becoming Human turns, more centrally, to the question of “species” in scientific discourse. Having established the plastic function of blackness in the still active metaphysics of The Great Chain and the conditioning absent presence of black mater for Heideggerian scales of being, Becoming Human moves from an investigation of the philosophical production of “the animal” to the scientific production of “species.” I demonstrate that in scientific discourse, antiblackness functions there, too, as an essential means of arranging human–animal and human–nonhuman
distinctions. Chapter 3, the penultimate chapter, “Not Our Own: Sex, Genre, and the Insect Poetics of Octavia Butler’s ‘Bloodchild,’” begins an inquiry into the constitutive role of antiblackness for the logics of scientific taxonomical species hierarchies. The chapter identifies the agentic capaciousness of embodied somatic processes and investigates how matter’s efficacies register social inscription. Chapter 3 provides a reading of risk, sex, and embodiment in Butler’s “Bloodchild,” a text that affirms the continued importance of risk for establishing new modes of life and worlding, despite historical violence and embodied vulnerability. “Bloodchild” is instructive for situating the racial, gendered-sexual politics of the idea of evolutionary association, or symbiogenesis, in the historical discourses of evolutionary and cell biology, as well as deposing a cross-racially hegemonic conception of the autonomous, bounded body that underwrites phantasies of possessive individualism, self-ownership, and self-determination. Perhaps surprisingly, one organism in particular—lichen—has played no minor role in the idea of evolutionary association. As a material actor, lichen has been a source of imagination for troubling the idea of the human individual.

In 1868, when Swiss botanist Simon Schwendener put forth his theory that lichen were actually an association of a fungus or algae—modified fungi, rather than one or the other—he employed vexed social imagery (Schwendener). He argued that lichens represented a master–slave relation: the master was a fungus of the order Ascomycetes, “a parasite which is accustomed to live upon the work of others; its slaves are green algals, which it has sought out or indeed caught hold of, and forced into its service” (Schwendener 4). As Jan Sapp describes, his theory was met with “bitter opposition,” considered a threat to taxonomical classification and disciplinary boundaries (4). One commentator described the theory as “the unnatural union between a captive Algal damsel and tyrant Fungal master” (4). This theory would eventually be known as symbiosis. Similarly, the term “colonialism,” Eric C. Brown explains in Insect Poetics, “replays one of the most visible ways in which humans and insects have been compared: insect colonies take their name from the Latin verb colere, meaning ‘to cultivate,’ especially agriculturally” (xiv). This poetic Latinization of the zoological world extends the by-gone Roman Empire into the realms of contemporary biological science and political theory.
If, as Donna Haraway states in *How Like a Leaf*, “science fiction is political theory,” the penultimate chapter demonstrates that in Butler’s narratives, interspecies relations between humans and insects, parasites, viruses, protocists, fungi, and bacteria open up the question of what it means to be (human) rather than neatly map onto intrahuman relations and histories (120). This chapter aims to critically examine the stakes, possibilities, and problems of trans-species metaphors at the interface of Butler’s fiction and its criticism by examining how racial slavery and colonial ideas about gender, sexuality, and “nature,” more generally, have informed *evolutionary discourses on the origin of life itself* and our ideas of cellular biology by looking at the racialized history of the theory of symbiosis in relation to “Bloodchild,” Butler’s 1984 Hugo and Nebula Award–winning short story that creatively and philosophically reimagines symbiosis as well as what it means to be (human) and to have a body. Departing from the substitutional logic Sapp and Brown identify, chapter 3 explores how Butler’s fiction overturns commonly held conceptions of “the human’s” relation to the nonhuman not by analogy but by dislodging established presumptions regarding the fundaments of human subjectivity and the materiality of the body. With “Bloodchild,” Butler offers a reorientation to the subject and its related associated notions of subjectivity and subjectivation. Butler challenges conventions of literary genre and those genres of the human predicated on racial slavery and colonial narratives of possessive individualism, sovereignty, and self-determination through a literary meditation on sexuality beyond heteronormativity, sexuation beyond dimorphism, and reproduction beyond the man–woman dyad.

The fourth and final chapter, in an alternate reading of Audre Lorde’s *The Cancer Journals* and Wangeci Mutu’s cyborg figures in *Histology of the Different Classes of Uterine Tumors*, identifies the manner in which the nullification of black mater as *mater*, as matter, continues to underwrite contemporary species hierarchies, including that of race, as race is a “discourse of species.” This chapter, “Organs of War: Measurement and Ecologies of Dematerialization in the Works of Wangeci Mutu and Audre Lorde,” identifies the contemporary reorganization of racially sexuating bio-economies by examining biotechnology, tissue economies, and epigenetic discourse as well as furthers an investigation into the stakes of the manner in which the agencies of the organismic body
shape and are shaped by an antiblack world. “Racism,” Sylvia Wynter argues, “is an effect of the biocentric conception of the human” (“Biocentric” 364, emphasis added). Biocentrism, as defined by Wynter, is a peculiar yet hegemonic logic of species; it espouses the belief that we are “biological beings who then create culture” (361). In other words, according to a biocentric logic, human cultural practices are linearly determined by groups’ respective bio-ontological composition, which are vertically arranged by nature itself. Wynter contrasts this belief system’s reductive investment in DNA as substratum and mechanistic causation with an alternative she terms sociogeny: “My proposal is that we are bi-evolutionarily prepared by means of language to inscript and autoinstitute ourselves in this or that modality of the human, always in adaptive response to the ecological as well as to the geopolitical circumstances in which we find ourselves” (“Biocentric” 361). With sociogeny, Wynter joins other critics of nature–culture binarism, perhaps most notably Haraway’s natureculture, which has been recently extended by ecofeminist and feminist materialist conceptions such as Samantha Frost’s “bioculture,” Staci Alaimo’s “trans-corporeality,” and Karen Barad’s “entanglement” and “intra-action.” But Wynter raises the stakes of these critiques by arguing that affect and desire are determinant of both nature and culture as their coproduction (matter and meaning) is given dynamic expression by biocentrism’s raciality, which is to say our studied critiques of nature–culture oppositions and the phenomenon itself are inside of the economies of affect and desire generated by raciality.

Departing from an exclusive focus on structure, whether it be that of the double-helix or scaled up to the symbolic order, I argue that black female sex(uality) and reproduction are better understood via a framework of emergence and within the context of iterative, intra-active multiscalar systems—biological, psychological, environmental, and cultural. Mutu’s Histology of the Different Classes of Uterine Tumors crucially reveals the stakes of this intra-activity as it pertains to the semio-material history of “the black female body,” reproductive function, and sex(ality) as linchpin and opposable limit of “the human” in scientific taxonomies and medical science, particularly that of Linnaeus’s Systema Naturae and Ernst Haeckel’s highly aesthetic approach to evolutionary theory. Mutu’s art is notable for its constructive reorientation of the theorization of race via a reflexive methodological practice of collage, one that reframes
the spectatorial encounter from that of a determinate Kantian linear teleological drama of subjects and objects to that of intra-active processes and indeterminate feedback loops. Thus, this is not a study of a reified object but of an intra-actional field that includes material objects but is not limited to them.

While chapter 4 is principally concerned with the work of Mutu, I maintain that Lorde offers insights that are generative for a fuller appreciation of Mutu's critical artistic engagement with the racialization of biological reproductive systems and its somatic effects. Lorde's *The Cancer Journals* was one of the first critical analyses of female reproductive cancers to put forth an understanding of the body as an emergent and co-productive intra-actional system and to emphasize that semio-affective-psychic relations are crucial determinants of physiological processes. Lorde contends in *The Cancer Journals* that carcinogenesis is a feedback loop encompassing biological, psychological, environmental, and cultural agencies and, therefore, neither a matter of individualized disease nor inferior biology but rather a somaticization of politics, and, by politics, I mean war.

The coda closes *Becoming Human* with a consideration of recent developments in the biological sciences and biotechnology that have turned their attention to narrating the problem of “racial health disparity” in reproductive health. I suggest that work on the epigenome, mostly housed in the regulatory sciences—epidemiology and public health—possesses contradictory potential and thus uncertain possibilities with respect to (dis)articulating the antiblack logics that have conditioned the symbiosis of teleological determinism and evolutionary thought (whereby a developmental conception of “the human” is only one of its most obvious instantiations). Bringing the epigenome in conversation with my theory of ontologized plasticity, I argue that Mutu's aesthetic strategies, along with those of Legae, Douglass, Morrison, Hopkinson, and Lorde, featured in *Becoming Human* reveal a potential (with neither guarantee nor a manifest horizon of possibility—but a potential, nonetheless) for mutation beyond a mode of thought and representation that continually adheres to predefined rules and narratives that legitimate antiblack ordering and premature death.

I do not suggest consensus across the texts in this study, rather I am highlighting evidence of a disturbance within “the human’s” epistemolo-
gies and horizon of meaning. This disturbance is suggestive of how we might theorize anew the paradoxes of regimes of knowledge and being that gave rise to the ongoing exigencies of enslavement and colonial modernity. Furthermore, they are highly innovative, creatively offering contrary and often counterintuitive approaches for how we might see humans and animals differently. I am less interested in finding a universal posture toward humanism in the form of a prescription on how we should be (human) or treat animals. That would run the risk of simply inverting the paradigmatic universal subject, obscuring the particular situatedness of my subject(s) by reproducing the normative logic of imperial humanism, one that equates an idealized Western subjectivity with universal law and universal law with justice. And, as we have seen, law may obscure ethics and justice because laws always point to a specific lived, historical, and embodied subjectivity—one that is not universally shared. I approach what follows without investing in any foundational authority, whether in philosophy, law, or science, because I do not believe it is necessary for ethical action; instead, this study takes as its central task the unsettling of foundational authority. It is precisely the condition of the absence of foundational authority that has commonly grounded black ethics.

Historically, foundational authority has either been hostile to or denied the possibility of black intellectualism and disqualified black people from ethical consideration. The seeds planted in the pages that follow spring from the embattled epistemology of peoples living at the vanishing point between direct domination and hegemony but who nevertheless generate a centrifugal and dissident way of being, feeling, and knowing existence.
