For this week's meeting, I will attempt to summarize our thinking thus far on different types of head movement and how these interact with the process of Spell-out to the PF branch. In particular, I will give a brief overview of our proposals regarding narrow syntactic movement of phase heads both before and after Spell-out of the phase and the implications of this for a model of triggered Spell-out, head-lowering, phase head impenetrability, and the notion of phases as derivationally discrete lexical, functional, and discourse domains. Central to this discussion will be the timing of feature-checking operations wrt the process of Spell-out. Other issues that might be discussed include a cross-linguistic difference in the mechanisms underlying tense-hopping (i.e. Lowering vs. Local Dislocation) and the status of auxiliary verbs in English. The overall goal of this meeting will be to hold a group discussion that helps us to better define a complete, organic model of different non-phrasal transformations.
