1. PURPOSE

This Standard Operating Procedure (SOP) provides instruction on how to set humane intervention points for animals used as part of McGill University's institutional training program.

2. RESPONSIBILITY

Veterinary care staff, Facility Animal Care Committee (FACC).

3. INTRODUCTION

3.1. Animals used for teaching and training are not being used to discover, prove, or develop new ideas and techniques and should only be used where it is based on sound ethical justification and proven educational objectives that demonstrate pedagogical merit.

3.2. Animals are used in training to develop manual skills and expertise in specific techniques (for example, animal handling or surgical skills).

3.3. Before any animal is used for training, efforts should be made to find a replacement alternative. Replacement alternatives may include:

   3.3.1. Film and video.
   3.3.2. Models, mannequins and simulators.
   3.3.3. Multimedia computer simulation.
   3.3.4. Ethically-sourced animal cadavers and tissue.
   3.3.5. Clinical work with animal patients and volunteers.
   3.3.6. Student self-experimentation.
   3.3.7. In vitro labs.
   3.3.8. Non-invasive field studies.

3.4. If no pedagogically sound replacement is available, then effort should be made to reduce the number of animals used and refine techniques.

3.5. Humane intervention points are clear criteria set to prevent or relieve unnecessary pain or distress to animals used as part of the institutional training program. Humane interventions are defined as actions or instructions including, but not limited to, the following:

   3.5.1. Limiting the frequency and number of training sessions for each animal.
   3.5.2. Limiting number of manipulations per training session.
   3.5.3. Adequate veterinary treatment, analgesia and/or supportive therapy to the animal(s).
   3.5.4. Euthanasia.

3.6. The current training program for rodents is divided into Modules, each Module regrouping a small number of techniques or procedures. Refer to the description of the Modules here: http://mcgill.ca/cmarc/workshops. This SOP takes into consideration that Modules encompassing non-invasive, CCAC invasiveness category B procedures, e.g., handling, restraint, inhalant anesthesia, are more frequent that those with more invasive, CCAC invasiveness category C procedures, such as injections or blood collection.
Example of the typical sequence of use for a cage of training rodents:

4. **PROCEDURES**

4.1. Animal selection:
   
   4.1.1. Rodents used in training should not be kept past the age of 12 months.
   
   4.1.2. When animals are received as donations from another Animal Use Protocol (AUP), select animals of strains or genotypes that do not demonstrate any traits that affect the general condition and wellbeing of the animals.
   
   4.1.3. Animals that are donated to be used for training purposes should be experimentally naïve.

4.2. Identification and Recordkeeping:
   
   4.2.1. Clearly identify animals or cages of animals used in training.
   
   4.2.2. Maintain records for each group of animal used for training purposes that include:
      
      4.2.2.1. Source of the animals, i.e., vendor information or AUP.
      
      4.2.2.2. Date donated or date received.
      
      4.2.2.3. Date of birth.
      
      4.2.2.4. Details for each training session including the date and type of training.

4.3. Training using conscious animals:
   
   4.3.1. Each animal is to be used for one procedure per training session.
   
   4.3.2. Limit the number of trials to 3 for each procedure per training session, per animal. After 3 unsuccessful trials, use a different animal.
   
   4.3.3. Invasive procedures must be performed under terminal general anesthesia.

4.4. Training using anesthetized animals:
   
   4.4.1. For procedures that are demonstrated while animals are under general anesthesia, where animals will recover, limit the training to a maximum of 3 procedures per session. Limit the number of trials to 3 for each procedure per training session, per animal. Administer analgesia following procedures that may cause pain or discomfort.
   
   4.4.2. For procedures that are demonstrated while animals are under terminal general anesthesia, i.e., the animals will not recover from anesthesia, there is no set limit for the number of procedures that can be performed. Animals should be euthanized before recovery from anesthesia.

4.5. Humane intervention points for rodents:
   
   4.5.1. Limit the number of training sessions to once every 7 days for each animal, regardless of the procedure.
   
   4.5.2. Animals that exhibit signs of discomfort or distress following a training session should not be used for a minimum of 14 days.
   
   4.5.3. Limit the total number of training sessions to a maximum of 6 per animal, regardless of the procedure, taking into consideration that the most frequently requested training sessions involve non-invasive procedures such as handling/restraint. The sixth training session is terminal.
   
   4.5.4. Euthanize animals that exhibit signs of illness, injury or poor general condition.

4.6. Humane intervention points for large animals:
   
   4.6.1. Limit the number of training sessions to once every 7 days for each animal, regardless of the procedure.
   
   4.6.2. Animals that exhibit signs of discomfort or distress following a training session should not be used for a minimum of 14 days.
   
   4.6.3. Animals that exhibit signs of illness, injury or poor general condition must be given a 1-month rest period.
