

## Lumbar Spine Stenosis Algorithm

Definition: Clinical Syndrome of gradual onset of Intermittent buttock or lower extremity pain, with or without back pain<sup>1,8</sup>. Symptoms are aggravated by standing or walking (neurogenic claudication<sup>3,6</sup>) and relieved by sitting or leaning forward<sup>1,3,4,5,7,8</sup>. Spinal stenosis is associated with decreased space available for neural elements (thecal sac and/or exiting nerve roots<sup>3</sup>) and epidural veins in the lumbar spine<sup>1,7,8</sup>.

The typical patient has a stooped forward posture, restricted lumbar extension, thigh pain with 30 seconds of lumbar extension.

Must differentiate from other conditions such as:

Peripheral Vascular Disease (Measure ankle brachial index)<sup>1,2,3,4,5,6,8</sup>

Diabetes<sup>1,4,6,8</sup>

Peripheral Neuropathy<sup>1,4,5,6,8</sup>

Hip/Knee Osteoarthritis<sup>1,5,6,8</sup>

Classify your patient into one of five broad categories];
```

Initial assessment of any back pain patient

Establish Standardized Score:

Ask patient to complete the Zurich Claudication Questionnaire<sup>9</sup> and document score

Ask patient to complete the STarT Back Screening Tool (SBST) and document score

Assess your patient:

Conduct a focused history and physical examination

Review the standardized questionnaire scores

Classify your patient into one of five broad categories

Presence of Red Flags:

New Bowel/Bladder incontinence or retention; recent severe trauma; progressive paraparesis, quadraparesis, neurologic signs → Send to emergency in your RUIS (Réseau Universitaire Intégré de Santé)

Unexplained weight loss (>10 lbs over 6 months), fever, chills, saddle anaesthesia without new bowel/bladder incontinence or retention; acute pain not eased by recumbent position; incremental non-relenting pain → page spine resident in the Emergency room of your RUIS

Unsteadiness of gait, weakness, numb/clumsy fingers → go to myelopathy algorithm

Lumbar Spinal Stenosis  
Typical patient > 50yr old<sup>1,3,4,5,8</sup>

Non-Specific Low Back Pain (NSLBP) → Go to Acute/subacute non-specific low back pain algorithm

Unilateral leg pain below the knee (with/without numbness and weakness) → Go to radiculopathy algorithm

Educate:

Reassure patients → development of cauda equina syndrome or severe progressive neurologic deficit rare<sup>3,4,5,6,7</sup>.

Advise patients to stay active

Promote self management

Discourage bed rest

Prescribe medication for pain relief (if needed):

Gabapentin<sup>4,10</sup>

NSAIDs<sup>1,3,6</sup>

Non-narcotic analgesics<sup>6</sup>

Narcotic analgesics (short course of maximum 2 weeks only if necessary)<sup>3,5</sup>

Prescribe Physiotherapy:

Strengthening of core muscles<sup>1,3,5,11</sup>

Stretching of lower extremity muscles (hamstrings, quadriceps, hip flexors)<sup>1,11</sup>

Lumbar flexion exercises (e.g. cycling)<sup>3,4,5,11</sup>

Avoid Lumbar extension exercises<sup>4,8</sup>

Elastic Lumbar binder (Wear only for brief periods to avoid deconditioning of para-spinal muscles)<sup>8</sup>

Follow-up visit (4-6 weeks after initial visit):

Purpose: keep the diagnosis under review and re-assess patient's symptoms

Establish standardized scores again

Address any yellow flags or red flags

Improvement

Continue with same treatment  
Re-assess regularly (every 6 months)

No improvement

Diagnostic Imaging:  
MRI or CT myelograph (if MRI inconclusive or contraindicated)  
CT scan (if MRI and CT myelograph are inconclusive, contraindicated or inappropriate)  
Maintain intermittent communication with patient while awaiting imaging results

MRI reported as mild-moderate spinal canal or neuroforaminal stenosis

Fluoroscopically guided epidural injection (ESI)<sup>1,12,13,14</sup>  
by:  
Physiatrist  
Pain management specialist

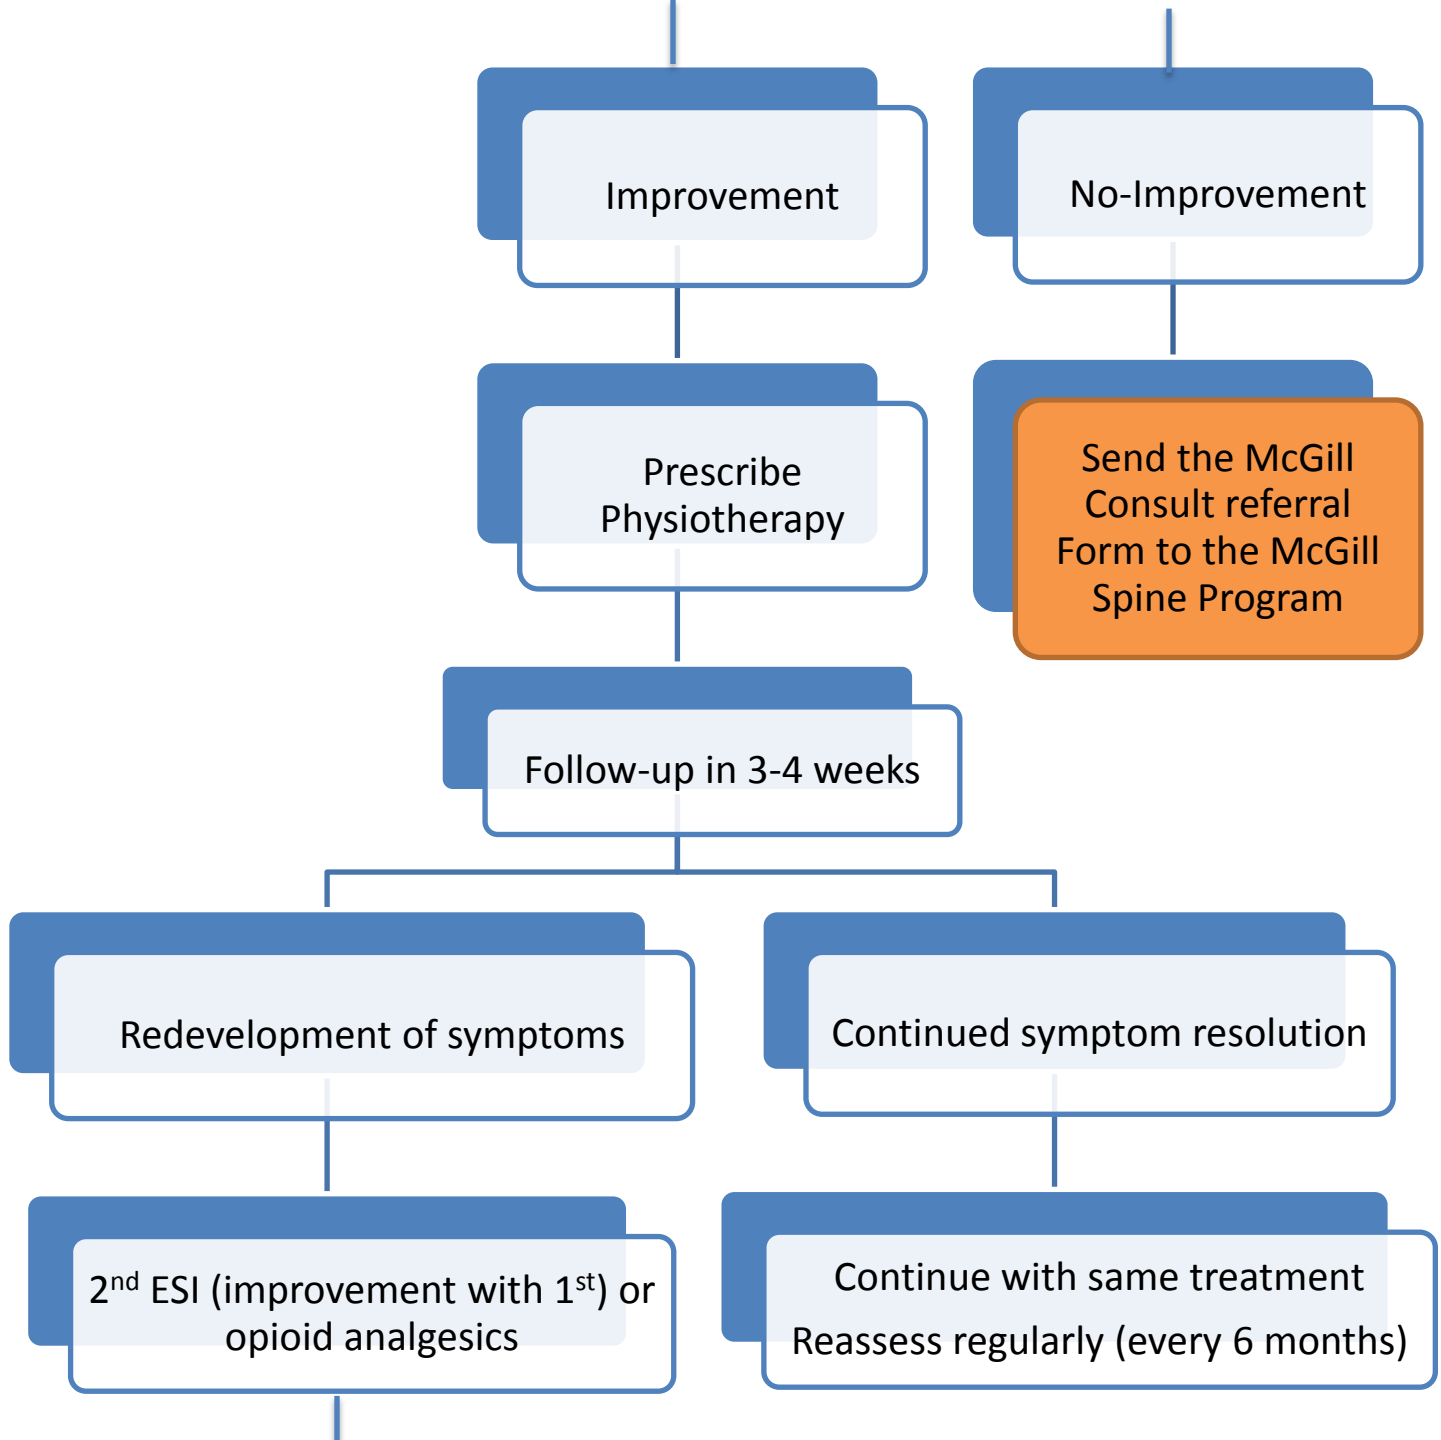

Follow-up in 3-4 weeks

MRI reported as severe spinal canal or neuroforaminal stenosis

Send the McGill Consult referral Form to the McGill Spine Program

MRI showed no evidence of spinal canal or neuroforaminal stenosis

Not a neurocompressive disorder  
Further work-up for neuropathy/other pathology  
Refer patient to Neurologist for further assessment

Triage

Pre-visit Triage: Triager reviews patient consult and MRI/CT

Spine program initial visit: Keep diagnosis under review, looking for pathoanatomical causes related to symptoms

Establish standardized score:  
Ask patient to complete the spine program survey (Including the Zurich Claudication Questionnaire) and compare to latest score from referring physician's office

Assess patient and make a decision

Tertiary care not required

Patient reassurance provided

Patient needs further non-operative specialized, multidisciplinary care

Psychologist  
Physiatrist  
Physiotherapist  
GP – Sports Medicine

Patient is a surgical candidate

Request further imaging for surgical planning:  
Standing AP and lateral  
Scoliosis series  
Flexion/Extension X-rays of  
the Lumbar Spine

Surgeon decides on different surgical options:  
Decompressive Surgery  
Lumbar fusion
