

Management of Occupational Monkey-related Injuries

Procedure for the Division of Infectious Diseases – updated 5 Feb 2024

Background:

Several research laboratories in the Montreal area work with non-human primates, and occupational injuries are a common occurrence. For many years, the *Centre for Tropical and Geographic Medicine* (commonly known as the Centre for Tropical Diseases – TDC) has provided consultation services for occupational monkey injuries to standardize management and facilitate communication with the occupational health offices of individual labs. During business hours monkey injuries are seen by the TDC physician on call. However, employees are occasionally directed to our ED if they cannot be assessed in clinic within 24 hours. **This Procedure document is meant to provide guidance to ID consultants who are asked to evaluate these cases.**

Support from the TDC

The TDC provides a consultation service on call for questions from ID consultants, including for monkey injuries. In any case where the ID consultant is unsure about any aspect of patient management or related documentation, the TDC physician on call (**listed in Petal MD**) can be contacted for guidance.

Decision Aid, scope, and limitations

- The Decision Tool in the Appendix can assist consultants in making the appropriate management decisions. The Decision Tool can also be found as a template in O-word, under the Tropical Medicine category, to aid in documenting the consultation process.
- Note that **this tool is designed for laboratory injuries**, where the animals can generally be identified, and routine measures for animal surveillance, testing, and necropsies are managed by the internal Occupational Health offices.
- This tool is not intended for animal injuries which happen in other circumstances (eg: travellers) nor in situations where there is no local occupational health officer able to oversee follow up of both the animal and employee. These latter situations require assessment and management as for any ID consultation.

Baseline serology and forms

- **Please note that baseline Herpes B serology for employees who are clinically well is ALWAYS the responsibility of the local occupational health office, and should not be drawn or stored at our institution.**
- However, if an employee is symptomatic and clinically suspected of Herpes B disease in the differential diagnosis, the consultant should take all necessary measures required for the diagnosis and management of the patient as clinically indicated.
- As for any occupational accident, the appropriate CNESST form should be completed by the physician who has assumed the care of the patient.

Follow up

- In general, any injury which is deemed serious enough to require follow-up evaluations should be sent to the next available TDC clinic.
- Please inform the TDC physician on call of the need for follow up, and interim clinical plans.
- In some cases, other services, such as plastic surgery, may need to be consulted as well.
